

AC AND NULL METHOD ANALOG MEASURING INSTRUMENTS

Prof. Yasser Mostafa Kadah – www.k-space.org

EE 306 – SS2016

Electrodynamic (Dynamometer) Instrument

Action of this type of instrument depends upon electromagnetic force exerted between fixed and moving coils carrying current

Deflecting force on each side of M

 \propto (current in M)

 \times (density of magnetic field due to current in F)

 \propto current in M \times current in F

Electrodynamic (Dynamometer) Wattmeter

- Owing to the higher cost and low sensitivity of dynamometer ammeters and voltmeters, they are rarely used commercially
- However, electrodynamic or dynamometer wattmeters are important and commonly employed for measuring power in a.c. circuits
 - Fixed coils F are connected in series with the load, moving coil M is connected in series with non-reactive resistor R across the supply

Instantaneous force on each side of M ∝ (instantaneous current through F) × (instantaneous current through M) ∝ (instantaneous current through load) × (instantaneous p.d. across load) ∝ instantaneous power taken by load $\begin{array}{c|c}

Average deflecting force on M

 \propto average value of the power over a complete number of cycles

Rectifier AC Ammeters and Voltmeters

 Rectifier is used to convert AC current into unidirectional current

Mean value is measured using MC type instrument

- Main advantage: far more sensitive than other types of AC voltmeter and can be incorporated in universal instruments (e.g., Avometer)
 - Enabling MC instrument to be used in combination with bridge rectifier and suitable resistors to measure various ranges of alternating current and voltage

Oscilloscope

- Oscilloscope is the most important measuring device with graphical display
 - One of the most powerful diagnostic tools
 - Commonly used to measure exact wave shape of electrical signal, including the amplitude and frequency
 - Can also measure quantities such as pulse width, period and rise time, and can compare two signals and measure their relative timing
- Old technology relied on cathode-ray tube (CRT) display
 Cathode Ray Oscilloscope (CRO)
- Modern technology uses LCD or LED screens

Cathode-Ray Tube

 Cathode-ray tube was an important component of both cathode-ray oscilloscope (CRO) and old TVs

CRO now known as analog oscilloscopes to distinguish them from the now almost universally used digital oscilloscope

С	Indirectly heated cathode	
G	Control grid with negative bias	$\begin{array}{c c} C & G & A_1 & F & A_2 & Y & X \\ \hline \\$
A1/A2	Anode discs	
F	Focusing electrode	
X	Horizontal deflection plates	
Y	Vertical deflection plates	Electron beam
S	Fluorescent screen	$\circ \longrightarrow \circ$
В	Glass bulb evacuated	

Cathode-Ray Tube

- □ Electron lens: combination of A1, A2 and F
- Electron gun: system of electrodes producing the electron beam
- Electrostatic deflection systems of cathode-ray tube: plates X and Y

Cathode-Ray Oscilloscope (CRO)

- Input signal is amplified by Y-amplifier and causes beam to be driven up and down screen of CRT in Y direction
- □ Time base moves beam across the screen of the tube, in X-direction

Cathode-Ray Oscilloscope (CRO)

Detailed diagram

Waveform Measurement with CRO

- To aid observation of display on CRO, set of squares is marked on the transparent screen cover termed graticule
 - Graticules are marked out with a 1 cm grid and are generally 10 cm across by 8 cm high
 - To avoid parallax error, always observe trace directly through graticule and not from the side
- Ex: Let vertical control be set to 2 V/cm and time-base control to 500 μs/cm:
 - Peak-to-peak height of display is 4.8 cm, hence the peak-to-peak voltage is 4.8 × 2 = 9.6 V
 - length of one cycle of display is 8.0 cm, hence the period of the waveform is 8 × 500 × 10⁻⁶ = 4 ms and frequency of signal is 250 Hz

Examples

The trace displayed by a CRO is as shown in Fig. 45.20(a). The signal amplitude control is set to 0.5 V/cm and the time-base control to 100 s/cm. Determine the peak-to-peak voltage of the signal and its frequency.

Oscilloscope Connection

- Most oscilloscopes operate with the body or chassis of the instrument at earth potential
- Also, most oscilloscopes are connected to the signal source by means of a coaxial cable, the outer conductor of which is connected to the body of the oscilloscope and is therefore at earth potential
- It follows that one of the connections from the oscilloscope will connect one terminal of the signal source to earth

Oscilloscope Connection Challenges

- Amplifier transistor circuit shown could not be reconnected in order to observe the voltage across the base-collector junction
- Method 1: Isolation of the source from earth
- □ Method 2: Isolation of the load from the source
- Method 3: Dual-trace measurements
- Method 4: Isolation of the oscilloscope from earth

Null method: Measurement of Resistance by Wheatstone Bridge

- Bridge has two known resistances P and Q, known variable resistance
 R and the unknown resistance X
- Battery B is connected through switch S1 to C and F
- Galvanometer G, variable protection resistor A and switch S2 are in series across D and E
- With S1 and S2 closed, R is adjusted until there is no deflection on G

Very accurate because no loading effect is involved

$$PI_1 = RI_2 \qquad QI_1 = XI_2$$
$$\frac{Q}{P} = \frac{X}{R} \qquad X = R \times \frac{Q}{P}$$

Null Method: Measurement of Voltage by Potentiometer

- One of the most accurate instruments for measuring voltage
- Slider L position is adjusted until the galvanometer deflection is zero
 First time: for E1 (SC) and find length between M and L (1/2)
 Second time: for E2 (Unknown) and find length between M and L (1/2)
- Main advantage: no current flows at balance

Very accurate because no loading effect is involved

$$\frac{E_1}{E_2} = \frac{l_1}{l_2} \implies E_2 = E_1 \times l_2/l_1 \qquad \text{M} \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_1} \text{I}_1 \xrightarrow{I_2} \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_2} \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_2} \xrightarrow{I_2} \xrightarrow{I_2} \text{I}_1 \xrightarrow{I_2} \xrightarrow$$
