## Data Acquisition and Digital Filtering of Biomedical Signals

In the previous Lab Experiment, simulation for an ECG signal with AC interference was considered with result as shown below. Such interference can be removed using proper signal filtering that removes the frequency range of the interference while allowing original signal frequencies to pass without much change. In the previous Lab Experiment, this was considered using analog filters. In this experiment, we consider the application of digital filters for this purpose.

Design, conduct and analyze results of experiments to do the following:

- (A) Acquire the digital version of sample analog biomedical signal (e.g., ECG) using digital storage oscilloscope and determine the sampling rate and quantization level used.
- (B) Acquire the digital version of sample analog biomedical signals (e.g., ECG) using Biopac system and determine the sampling rate and quantization level used.
- (C) Change the sampling rate and quantization level of both of the above signals on the computer using Matlab and determine appropriate rate/level for both to preserve the signal and Compare the above two methods of data acquisition.
- (D) Repeat Lab Experiment #4 using digital filters to clean up the noisy ECG signal shown above using properly designed digital filters.

## **General Requirements**

- 1. Experimental <u>Design</u> procedure including all requirements of Assessment Rubrics must be ready and approved by Lab Engineer before conducting any experiment.
- 2. All students must <u>Conduct</u> the experiment and document it according to the requirements of Assessment Rubrics and approved by Lab Engineer after conducting any experiment.
- 3. You are free to select any components you prefer for your experiments.
- 4. You should be prepared to demonstrate your experimental setup and answer questions in all aspects related to your experiment.
- 5. You should work in groups of 2 students each. One report addressing all parts of Assessment Rubrics should be submitted on behalf of the whole group.

6. You may use any resources you find useful to your experiment as long as you acknowledge such use in your report in accordance to ethical guidelines.
